1. COSTS AND BENEFITS OVERVIEW

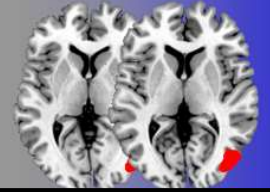

Reconstruction error

EMORY
ROLLINS
SCHOOL OF
PUBLIC
HEALTH

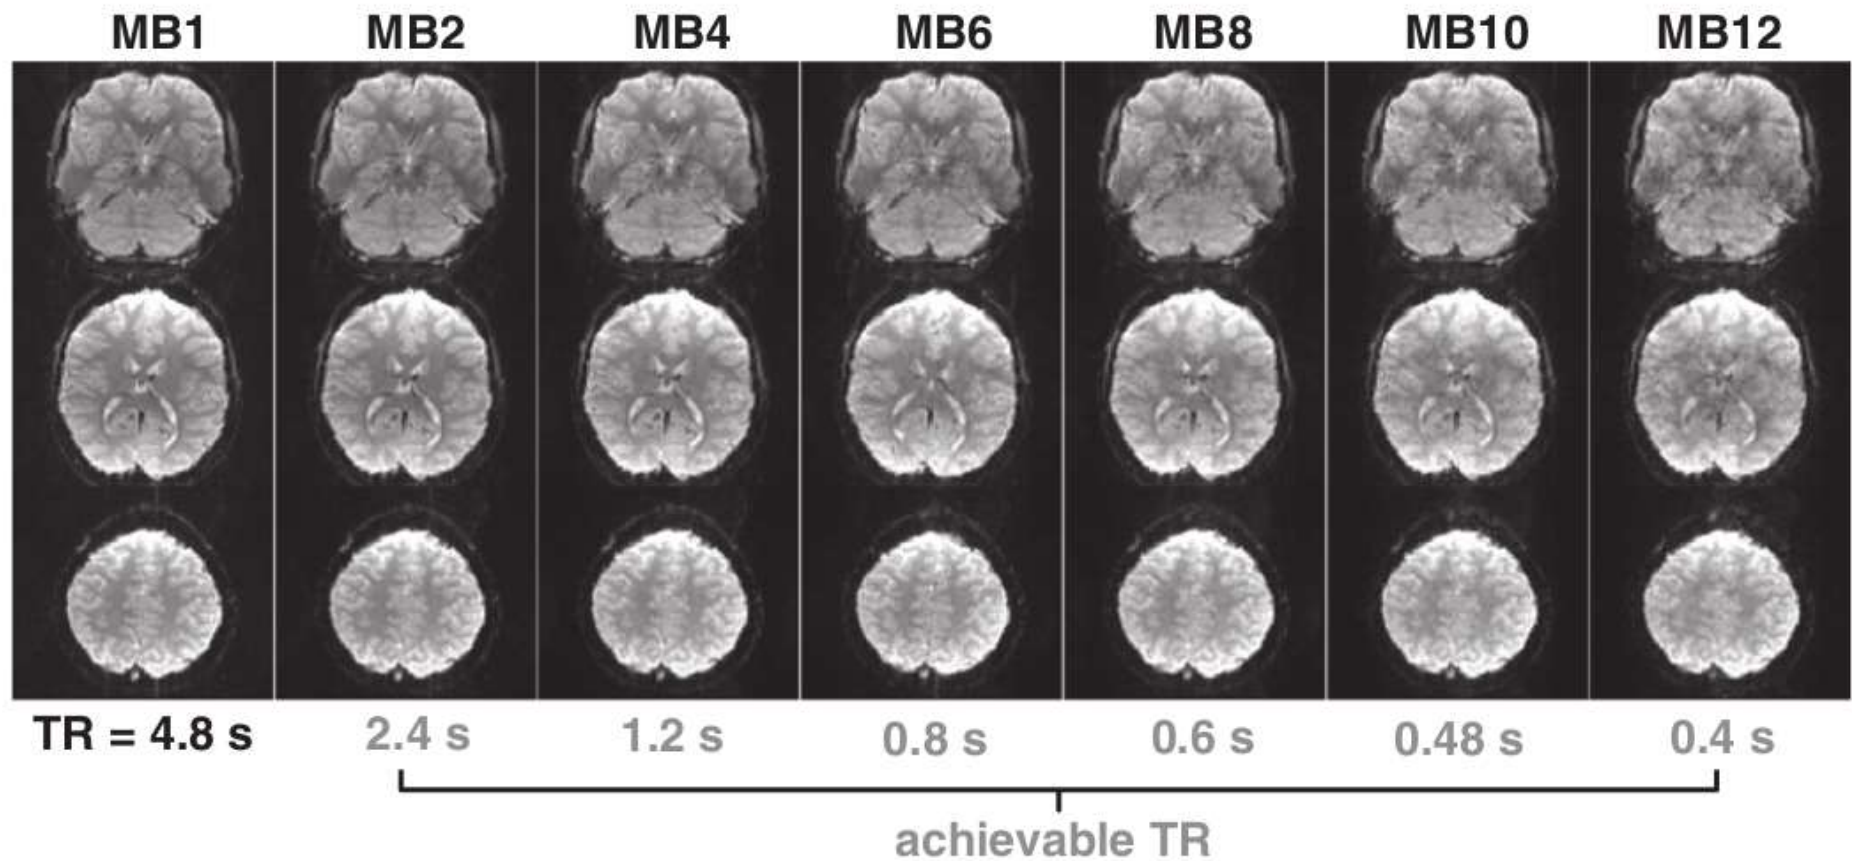

CBIS

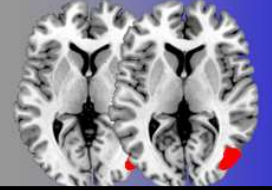

Center for Biomedical
Imaging Statistics

- Xu et al 2013 HCP Consortium:

Note: MB factor = SMS factor

- In acquisition literature, reconstruction error quantified using
 - G-factor: noise amplification (variance)
 - L-factor: signal leakage (bias)
- Here, we focus on test statistics.
- Two reconstruction methods:
 - Slice-GRAPPA (Setsompop 2012)
 - Split slice-GRAPPA (Cauley 2014) = Leak Block

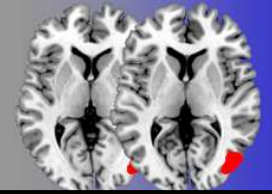

Slice leakage

CBIS

Center for Biomedical
Imaging Statistics

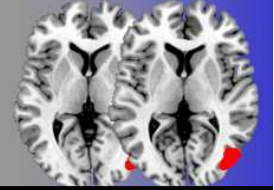

N. Todd et al. / NeuroImage 124 (2016) 32–42

- SMS decreases TR
- Benefits “indirect” because power in BOLD < 0.2 Hz (Nyquist 2.5 s)
- Boosts effective sample size – decreases SE
- Improve ability to separate physiological noise – ICA, lo-pass filtering

- Higher test statistics and/or larger number of activated voxels:
 - Task fMRI:
 - Chen et al 2015
 - Boyacioglu et al 2015
 - Demetriou et al 2015
 - Todd et al 2016, 2017
 - Resting state fMRI:
 - Feinberg et al 2010
 - Preibisch et al 2015

2. CALCULATING ALIASING PATTERNS

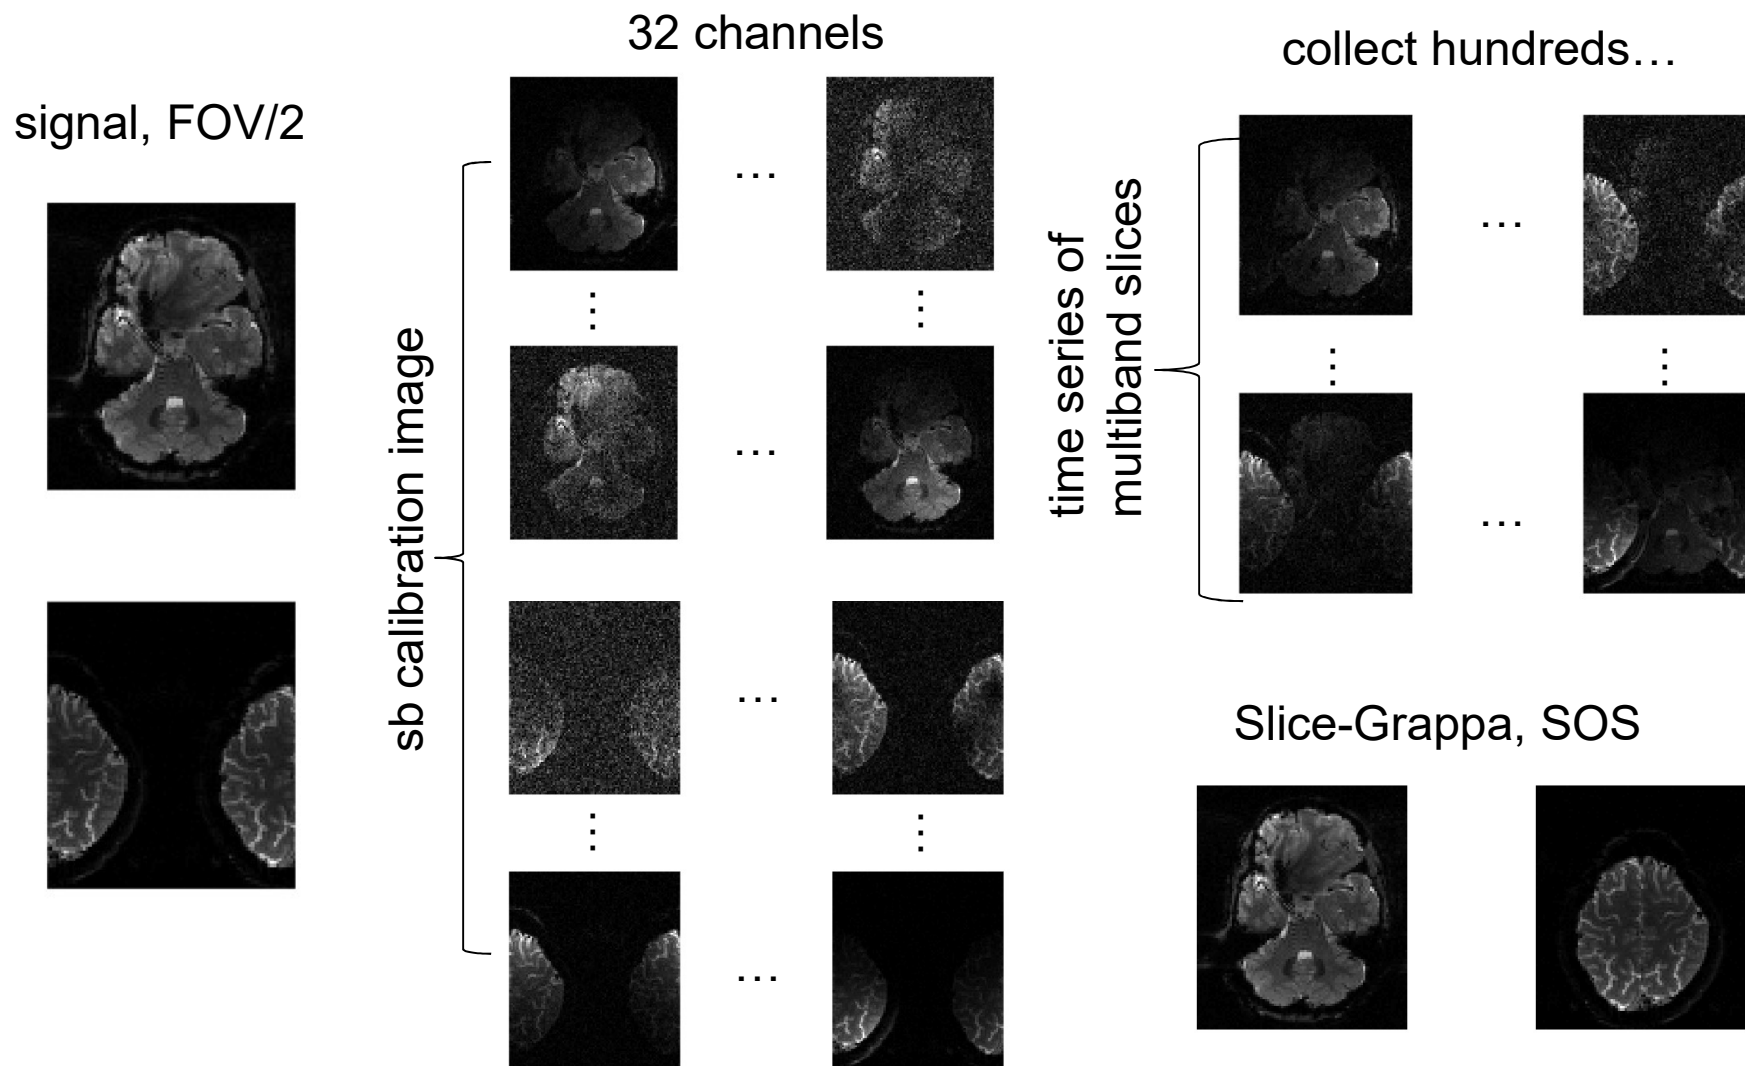

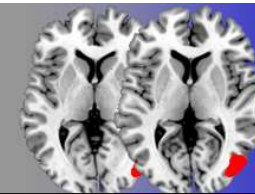

Example SMS = 2

EMORY
ROLLINS
SCHOOL OF
PUBLIC
HEALTH

CBIS

Center for Biomedical
Imaging Statistics

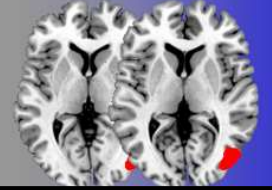

Ex: SMS = 8, FOV/3

EMORY
ROLLINS
SCHOOL OF
PUBLIC
HEALTH

CBIS

Center for Biomedical
Imaging Statistics

- Suppose 72 slices, SMS = 8
- $72 / 8 = 9$ packets
 - Slice 1 = packet 1
 - ...
 - Slice 9 = packet 9
 - Slice 10 = packet 1...
- Packet 1: Slices 1, 10, 19, 28, 37, 46, 55, 64
- FOV/3 with 90: (1,1,1) aliased to (1,31,10), (1,61,19), (1,1,28), (1,31,37), (1,61,46), (1,1,55), (1,31,64)

Regional aliasing

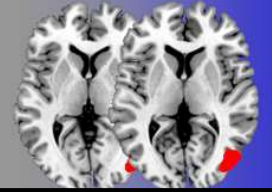

EMORY
ROLLINS
SCHOOL OF
PUBLIC
HEALTH

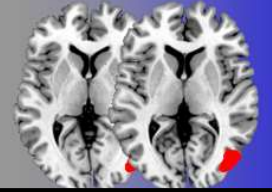

CBIS

Center for Biomedical
Imaging Statistics

- Realized leakage has stochastic component due to measurement error
- B0 inhomogeneities and gradient non-linearities
- Motion correction
- Registration to MNI
- Predicting aliasing in processed data and group analyses is difficult

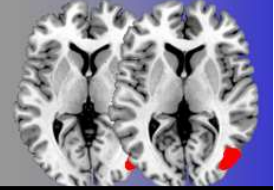

Joint work:

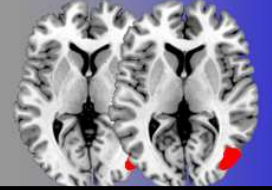

Mary Kociuba, University of Washington, Seattle, WA

Dan Rowe, Marquette University, Milwaukee, WI

3. SIMULATION STUDY: SENSITIVITY & SPECIFICITY

- Larger test statistics in presence of bias = false positives
- Bias from signal leakage:
 - Slice leakage – spurious regions
 - Smoothing leakage – overestimate region with true activation
- Smoothing interact with SMS?

- Sensitivity: correctly reject null hypothesis (1 – false negatives)
- Specificity: correctly fail to reject null hypothesis (1 – false positives)
- Factorial design motivated by HCP motor task:
 - FOV/3 or 0
 - SMS: 1, 4, 8
 - Scan duration: 120 s, 240 s, 480 s
 - 0 versus 6 mm FWHM smoothing

4. UNPROCESSED HCP DATA

- SMS = 8
- TR = 0.72 s
- Blipped-CAIPI: FOV/3
- Slice-GRAPPA reconstruction
- 2 runs: RL PE direction, LR
- Voxel size: 2 x 2 x 2
- Single-subject analyses motor task

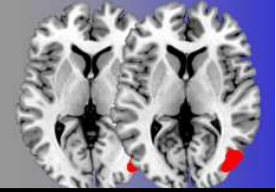

HCP leakage?

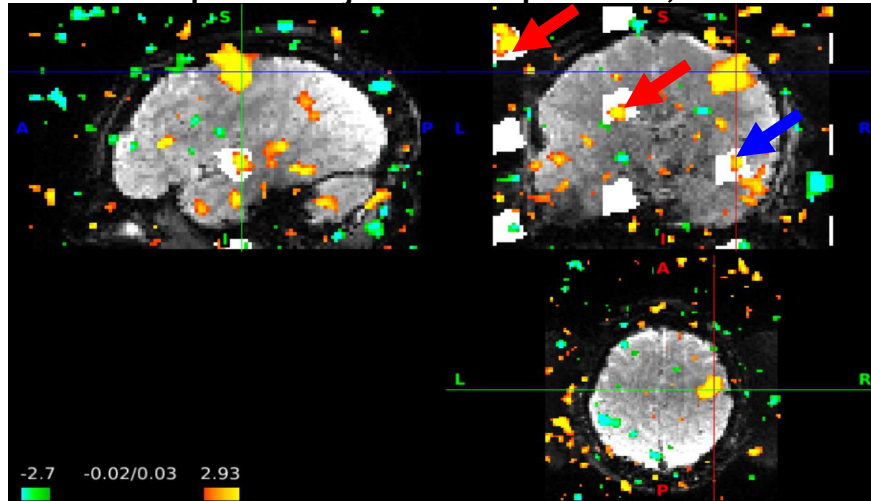

EMORY

Imaging Statistics

Example subject: LR predict, LR PE

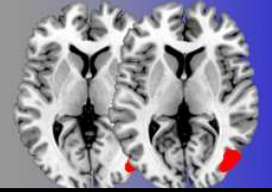

Example subject: RL predict, LR PE

- Analysis for both LR and RL runs, combined results

	$P_{matched}$	$P_{mismatched}$	Difference
1	0.023	0.020	0.003
2	0.027	0.017	0.010
3	0.066	0.050	0.016
4	0.050	0.050	0.000
5	0.036	0.026	0.009
6	0.014	0.009	0.005
7	0.014	0.014	0.000
8	0.028	0.027	0.001
9	0.041	0.049	-0.007
10	0.014	0.010	0.004
11	0.031	0.029	0.002
12	0.035	0.025	0.010
13	0.043	0.022	0.020
14	0.039	0.024	0.015
15	0.026	0.012	0.014
16	0.034	0.050	-0.015

Table 1: The proportion of voxels with $z > 2.326$ in the predicted aliased regions (matched) and in regions that are aliased using the opposite PE direction (mismatched). A larger proportion in $P_{matched}$ is considered evidence of slice leakage. One-sided Wilcoxon signed rank test: $p = 0.01$.

CBIS

Center for Biomedical
Imaging Statistics

- SMS can lead to higher test statistics
- SMS creates bias:
 - slice leakage
 - exacerbates smoothing leakage
- SMS improves sensitivity but decreases specificity
 - use moderate acceleration
 - minimal smoothing
- Split slice-GRAPPA dramatically decreases leakage, few costs?

- Preprocessed HCP: expect less leakage
 - minimal smoothing and gray matter areas
- Impacts in group studies?
- Residual noise artifacts likely to persist in split slice-GRAPPA
 - impacts estimated activation regions?
- SMS continues to evolve:
 - alternative FOV shifts (e.g., incoherent aliasing Zhu 2014), reconstruction methods, 3D acquisitions (e.g., wave-CAIPI Bilgic 2015)
